

each Vehicle Thread

Storage Zone

When in acceptable radius:
and IM detects the vehicle presence

- Sends REQUESTS
- Update every few sec
OR
Acceleration data?
- CANCEL changed requests
(car behind takes its place)

Intersection Manager

- Receive REQUESTS
- Arranges in First Ready Out
- CANCEL late REQUEST

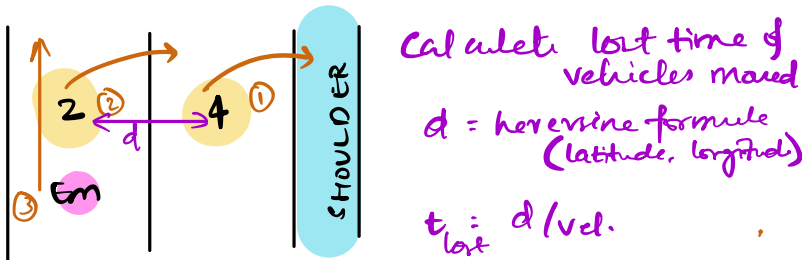

Late: Stopped sending data

Prioritization (EV detected)

Vehicles receiving YIELD:

- Decelerates, move to shoulder

MOVED REQUEST w/ new time

- Send YIELD signal to veh. in front of EV

Based on ID

- YIELD contains direction to be moved.

- CONFIRM to Em as all nodes are empty in their direction

MOVED REQUEST w/ new time

t_5 moves to EV lane
 $t_5^{new} = t_{emergency} + t_{reenter}$
upto # of vehicles moved due to EV

$$t_{shoulder} = t_{old} + t_{lost} + t_{reenter}$$

$$t_{reenter} = t_{adjacent}$$

$$t_{right.lane} = t_{old} + t_{lost}$$

$$t_{emergency} = t_{old}$$

6

Vehicle Reached intersection CONFLICT ZONE

- EM goes only 1 ways

Vehicles pass nodes
at n seconds / node

- IM blocks EV routes
- Dequeue REQUESTs to all direction N-S, N-E
- Update vehicle presence in nodes

EXIT ZONE arrays

Vehicles sent EXITED msg
